MAIL DATE

DELIVERY MODE

10/28/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/590,629	Applicant(s) KIMOTO, TAKAHIRO	
	Examiner JEAN D. SAINT CYR	Art Unit 2623	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 13-31 is/are pending in the application.
- 4a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 13-31 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 08 May 2007 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. ____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claims 13-31, filed 05/08/2007, are presented for examination.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 13, 15-16, 18, 19, 20, 21, 22, 24, 25, 26, 28, 30, 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mori in view of Watson, US.20040133923

Re claim 13, Mori et al did not clearly disclose an information delivery system (see fig.2, broadcast information server) for causing a receiving terminal to conduct pre-reading processing prior to data reproduction processing(a broadcast reception apparatus that has a function to previously read and cache high-use-possibility reproduction programs, Paragraph 40), select suitable data from a candidate program head data group in a received data storage and reproduce the selected data at time of reproduction, and change over reproduction data at time when following data is delivered from a transmitter(see fig.6 where the program execution unit receives production program from storage unit and display it on the display unit),

wherein the candidate program head data group is a set of head data of sequence data corresponding to one reproduction environment or a plurality of reproduction environments of a receiving terminal, in one candidate program or a plurality of candidate programs that might be viewed by a user at a single opportunity(determining the reproduction program to be cached, among the candidate reproduction programs,

Art Unit: 2623

paragraph 42; that means user can select at least one of the candidate program for viewing).

But Mori et al did not explicitly disclose reproduce the selected data at time of reproduction.

However, Watson et al disclose A movie may arrive and be stored in the set-top box, however it may have a start date associated with it which does not allow it to be viewed until that date,0014.

It would have been obvious for any person of ordinary skill in the art at that time the invention was made to introduce a reproduction time into the system of Mori, as taught by Watson, for the purpose of establishing synchronization between the delivery system and the receiving system.

Re claim 15, Mori et al disclose wherein the candidate program is a subset of programs obtained as a result of retrieval processing for all programs (when there are a plurality of candidate reproduction programs and the candidate reproduction programs correspond to a plurality of contents, a reproduction program having the highest corresponding contents number is preferentially selected, paragraph 21).

Re claim 16, Mori et al disclose wherein the candidate program is a subset of programs restricted on the basis of personal information of a user from among all programs (a storage means for storing history information that shows history of genres to which contents having been viewed belong, paragraph 16; that means programs are restricted based on viewing history data)

Re claim 18, Mori et al disclose wherein the sequence transmission request transmitted by the receiving terminal comprises environment information concerning a current reproduction environment of the receiving terminal, and when reading out the

Art Unit: 2623

head sequence data from the received data storage, the reproduction sequence selector reads out the head sequence data having a data format most suitable for the current reproduction environment from the received data storage(it is supposed here that the contents are generated using any formats among HTML, XML, DVX, and JAVA, Paragraph 44; that means different formats are used in order to find the most suitable).

Re claim 19, Mori et al disclose wherein the head sequence data comprises management data for managing delivery service, upon reproducing the head sequence data, the receiving terminal transmits the management data to the transmitter(see fig.6, program for cache determining unit; this unit manages files), and

the transmitter determines an optimum data format of following data and delivers sequence data, on the basis of received management data(it is supposed here that the contents are generated using any formats among HTML, XML, DVX, and JAVA, paragraph 44; that means the transmitter can use any of those formats).

Re claim 20, is met as previously discussed with respect to claim 13.

Re claim 21, Mori et al disclose causing the receiving terminal to transmit a sequence transmission request to the transmitter to specify a sequence to be reproduced (see fig.7, receive channel selection from user);

causing the receiving terminal to read out head sequence data of a sequence requested to be reproduced, from the received data storage and reproduce the sequence data(see fig.6 where the program execution unit receives production program from storage unit and display it on the display unit);

causing the transmitter to receive the sequence transmission request, read out a following portion of the head sequence data included in sequence data of the sequence requested to be reproduced, from a transmission data storage, and delivering the

Art Unit: 2623

following sequence data to the receiving terminal (an input means for receiving a selection of channels from a viewer; a contents identifying means for identifying, by referring to the broadcast information, contents that are to be transmitted over the channels specified by the viewer, as viewing candidate contents, paragraph 42);

causing the receiving terminal to receive the following sequence data (see fig.6, reception unit) and change over between the head sequence data and the following sequence data; and reproducing the following sequence data (see fig.6, program for cache determining unit),

Re claim 22, is met as previously discussed with respect to claim 15.

Re claim 24, is met as previously discussed with respect to claim 18.

Re claim 25, is met as previously discussed with respect to claim 19.

Re claim 26, Mori et al disclose an information delivery apparatus serving as a transmitter included in an information delivery system (see fig.2, broadcast information server) for causing a receiving terminal to conduct pre-reading processing prior to data reproduction processing (a broadcast reception apparatus that has a function to previously read and cache high-use-possibility reproduction programs, Paragraph 40),

select suitable data from a candidate program head data group in a received data storage and reproduce the selected data at time of reproduction (see fig.6 where the program execution unit receives production program from storage unit and display it on the display unit), and change over reproduction data at time when following data is delivered from the transmitter(see fig.6, program for cache determining unit);

wherein the candidate program head data group is a set of head data of sequence data corresponding to one reproduction environment or a plurality of reproduction

Art Unit: 2623

environments of a receiving terminal, in one candidate program or a plurality of candidate programs that might be viewed by a user at a single opportunity (determining the reproduction program to be cached, among the candidate reproduction programs, paragraph 42; that means user can select at least one of the candidate program for viewing).

But Mori et al did not explicitly disclose reproduce the selected data at time of reproduction.

However, Watson et al disclose A movie may arrive and be stored in the set-top box, however it may have a start date associated with it which does not allow it to be viewed until that date,0014.

It would have been obvious for any person of ordinary skill in the art at that time the invention was made to introduce a reproduction time into the system of Mori, as taught by Watson, for the purpose of establishing synchronization between the delivery system and the receiving system.

Re claim 28, Mori et al disclose a receiving terminal(see fig.6, receiving unit) included in an information delivery system for causing the receiving terminal to conduct pre-reading processing prior to data reproduction processing (a broadcast reception apparatus that has a function to previously read and cache high-use-possibility reproduction programs, paragraph 40), select suitable data from a candidate program head data group in a received data storage and reproduce the selected data at time of reproduction, and change over reproduction data at time when following data is delivered from the transmitter(see fig.6, cache determining unit);

wherein the candidate program head data group is a set of head data of sequence data corresponding to one reproduction environment or a plurality of reproduction environments of a receiving terminal, in one candidate program or a plurality of

Art Unit: 2623

candidate programs that might be viewed by a user at a single opportunity (determining the reproduction program to be cached, among the candidate reproduction programs, paragraph 42; that means user can select at least one of the candidate programs for viewing).

But Mori et al did not explicitly disclose reproduce the selected data at time of reproduction.

However, Watson et al disclose A movie may arrive and be stored in the set-top box, however it may have a start date associated with it which does not allow it to be viewed until that date,0014.

It would have been obvious for any person of ordinary skill in the art at that time the invention was made to introduce a reproduction time into the system of Mori, as taught by Watson, for the purpose of establishing synchronization between the delivery system and the receiving system.

Re claim 30, Mori et al disclose an information relay apparatus (see fig.2, information server unit) included in an information delivery system for causing a receiving terminal to conduct pre-reading processing prior to data reproduction processing (a broadcast reception apparatus that has a function to previously read and cache high-use-possibility reproduction programs, paragraph 40), select suitable data from a candidate program head data group in a received data storage and reproduce the selected data at time of reproduction(see fig.6 where the program execution unit receives production program from storage unit and display it on the display unit), and change over reproduction data at time when following data is delivered from the transmitter (see fig.1; determining unit that switch from one program to another one);

wherein the candidate program head data group is a set of head data of sequence data corresponding to one reproduction environment or a plurality of reproduction

Art Unit: 2623

environments of a receiving terminal, in one candidate program or a plurality of candidate programs that might be viewed by a user at a single opportunity (determining the reproduction program to be cached, among the candidate reproduction programs, paragraph 42).

Re claim 31, Mori et al disclose comprising a request transmitter for generating a sequence transmission request to specify a reproduction sequence in the received terminal and transmitting the sequence transmission request to the transmitter (receive channel selection from user; that means a request for content was sent to the transmitter).

Claims 14, 17, 23, 27, 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mori et al in view of the "Admitted Prior Art".

Re claim 14, Mori et al disclose wherein the receiving terminal comprises:
a request transmitter for transmitting a sequence transmission request to the transmitter to specify a sequence to be reproduced (see fig.7, receive channel selection from user; that means the user sends a request to the transmitter) and outputting identification information of the sequence to be reproduced (see fig.g.7, receive broadcast data);

a reproduction sequence selector for reading out head sequence data of a sequence requested to be reproduced, from the received data storage(program executing unit 110 reads a reproduction program and a content from the reproduction program storage unit 109 and the contents storage unit 105, paragraph 63);

means for receiving following sequence data from the transmitter (see fig.7, receive broadcast data);

a switcher for changing over between the head sequence data and the following sequence data(changing Reproduction Program to be Cached, paragraph 100); and

a decoder for reproducing sequence data supplied from the switcher (see fig.7, decode broadcast data), and

But Mori et al did not explicitly disclose the transmitter comprises: a transmitting sequence selector for receiving the sequence transmission request from the receiving terminal, reading out a following portion of the head sequence data included in sequence data of the sequence requested to be reproduced, from a transmission data storage, and delivering the following sequence data to the receiving terminal.

However, Admitted Prior Art (Applicant drawing fig.1) disclose a transmitting selector 203 and a storage 200, it would have been obvious for any person of ordinary skill in the art at that time the invention was made to modify the admitted prior art for allowing the system to deliver sequence data to the terminal from storage data.

Re claim 17, Mori et al disclose wherein the receiving terminal comprises: a candidate program determiner for transmitting candidate program request information to the transmitter (see fig.6, program for cache determining unit); and

means for receiving the candidate program head data group from the transmitter (transmitting content, as viewing candidate contents);

But Mori et al did not disclose the transmitter comprises: a candidate program head data reader responsive to reception of the candidate program request information from the receiving terminal, for reading out a head data group of a candidate program from the transmission data storage and transmitting the candidate program head data group to the receiving terminal.

However, Admitted Prior Art discloses sequence data reader at transmitter.

It would have been obvious for any person of ordinary skill in the art at that time the invention was made to modify the admitted prior art for the purpose of reading out a head data group of candidate program from the transmission data storage and transmitting that candidate program to the terminal.

Re claim 23, is met as previously discussed with respect to claim 17.

Re claim 27, is met as previously discussed with respect to claim 14.

Re claim 29, is met as previously discussed with respect to claim 14.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jean Duclos Saintcyr whose phone number is 571-270-3224. The examiner can normally reach on M-F 7:30-5:00 PM EST. If attempts to reach the examiner by telephone are not successful, his supervisor, Brian Pendleton, can be reached on 571-272-7527. The fax number for the organization where the application or proceeding is assigned is 571-273-8300. Information regarding the status of an application may be obtained from the Patent Application Retrieval (PAIR) system. Status information for published applications may be obtained from either private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, dial 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
